Surveys on Informal Sector: Objectives, Method of Data Collection, Adequacy of the Procedure and Survey Findings

1. Introduction

- The term 'informal sector' not used in the Indian official statistics or in the NAS till recently
- The terms used in the NAS are 'organised' and 'unorganised'
- Organised sector comprises enterprises for which statistics available regularly
- Unorganised sector refers to enterprises for which regular information not available
- The term 'informal sector' used for the first time in NSS 55th Round (1999-2000)
- Survey defined *informal enterprises* as those with type of ownership as either proprietary or partnership
- Definition broadly consistent with that recommended by the Fifteenth ICLS

- To meet requirements for national accounting including assessment of the shares of various non-agricultural sectors in the country's GDP
- To meet the demands for data by planners and policy makers, researchers, and other users (for assessing the sizes of different sectors and their growth over time)

3. Surveys on Informal Sector

- (a) NSS 55th Round
- An integrated survey of households and *informal* enterprises carried out in NSS 55th Round (1999-2000)
- Subjects covered: Household consumer expenditure, Employment-unemployment and Informal non-agricultural enterprises
- The survey aimed to provide estimate of number of workers in the informal sector through two different approaches household approach vis-a-vis enterprise approach
- Non-agricultural enterprises covered:

Mfg.; Construction; Trading and repair services;

Hotels and restt.; Transport, storage and communications;

Financial intermediation; Real est., renting & business activities

Education, health & social work

Other community, social & personal service

Details about enterprises collected:

Certain characteristics of the enterprises

Fixed assets; Employment; Operating expenses and receipts

Value added, etc.

(b) Surveys Conducted Prior to NSS 55th Round

- Collection of data pertaining to informal sector units not a new feature of the Indian data-collection system
- Earlier enterprise surveys carried out by the NSSO and CSO since 1978-79 had a wider coverage
- Apart from informal sector, such surveys covered other non-government enterprise
- Unit-level data for the NSSO surveys available for sale on CD since 1986-87
- Possible to generate estimates for informal sector based on these surveys as type of ownership codes are available at unit-level
- There have been 4 such enterprise surveys (on manufacture and trade) prior to NSS 55th Round

(c) Surveys Conducted After NSS 55th Round

- 2 such surveys so far:
- (i) NSS 56th Round (2000-01) on unorganised manufacture
- (ii) NSS 57th Round (2001-02: survey under progress) on unorganised services (excluding trade and finance)
- Type of ownership of each sample enterprise is recorded
- Thus possible to obtain the required estimates for the informal sector
- NSS 57th Round Tabulation plan has provision for estimation of the following:
- (i) Per thousand distribution of enterprises as well as workers by type of ownership and activity at all-India level
- (ii) Per thousand distribution of enterprises as well as workers (all activities combined) by type of ownership at State level
- (iii) Per thousand distribution of enterprises by social group of owner at State level (for proprietary and partnership i.e. informal enterprises)
- (iv) Annual gross value added per worker by activity at State level (for proprietary and partnership i.e. informal enterprises).

4. Sample Design

- •Generally a stratified two or three-stage design adopted
- •First-stage units (FSUs) are villages and urban blocks
- •Ultimate-stage sampling units are enterprises
- •Large FSUs split into segments
- •From the segments formed, a sample of segments selected
- •EC frame giving count of enterprises and workers at the FSU level generally used as the sampling frame for FSU selection
- •UFS frame used for sampling if EB boundaries not identifiable
- •Frame of enterprises in the sample FSU prepared in the field
- •From the frame, a sample of enterprises selected circular systematically

•NSS 55th Round highlights:

•Enterprises listed in an FSU grouped into 12 strata by jointly considering their broad industry group (BIG) and enterprise class

A sample of 24 enterprises selected from each FSU

Complete enumeration if less than 24 enterprises in the FSU

Sample size of FSUs: 10,400 for central sample and 11,880 FSUs for state sample

- •At present, a team of two or three investigators along with one supervisor deployed for fieldwork in each FSU
- •Data are collected through interview
- •For enterprises run without fixed premises or within the household premises, data collected by visiting the households of the owners
- •For enterprises run within fixed premises, data collected from the site
- •If the enterprises maintain accounts (such cases being much less in number), data collected as per the available accounts
- •Otherwise, information furnished by owners is recorded after proper probing in case figures furnished by the respondents appear doubtful.
- •To capture the seasonal variation, survey period divided into sub-rounds
- •Equal number of FSUs allotted to each sub-round
- •Within a particular sub-round, fieldwork spread uniformly over different months

6. Netting Employment in the Informal Sector: Adequacy of the Procedure

- Adequate care taken to list invisible enterprises
- •This has enabled netting more such enterprises in the enterprise surveys as compared to the EC
- •In NSS 55th Round, to doubly ensure listing of such enterprises, 2 special items included in the listing schedule
- •Items included: number of self-employed members (home-based and those working without fixed premises) in the household with break-up for female and male, and number of distinct enterprises owned by such members
- •The practice repeated in NSS 57th Round but not in NSS 56th Round
- •Efficiency of the procedure could be tested by comparing results of NSS 55th Round vis-à-vis NSS 56th Round

7. Key Results of NSS 55th Round (1999-2000)

- Statement 1: Distribution of enterprises by type of ownership
- •Male and female proprietors respectively run 86% and 12% of the enterprises
- •Females run only 5% of the establishments

Statement 2: *Location of the enterprises*

- •78% run at fixed premises either within the household premises or outside
- •Proportion of enterprises run in the household premises is higher (39%) in case of own account enterprises (OAEs) as compared to the establishments (13%)
- •Higher proportion of enterprises run from the household premises in the rural areas

Statement 3: *Maintenance of accounts*

- •5% of enterprises maintain accounts
- •Maintenance of accounts is higher (21%) in case of establishments and quite low (about 3%) in the case of OAEs
- Cases of maintaining accounts higher in urban areas

Statement 4: Working on contract

- •About 11% of the enterprises undertaking at least some work on contract basis
- •Of the enterprises working on contract, 82% received the raw material from the master enterprise/contractor
- •The contractor in 87% of the enterprises also specified the design

Statement 5: *Number of workers*

- •Estimated number of workers as per the alternative approaches broadly comparable except in case of (i) Construction, (ii) Transport, storage and communication; and (iii) Other community, social and personal services
- •For the exceptional cases, differences in coverage of workers in the 2 approaches could partially explain the divergence

Statement 6: Value added per worker

•For all activities combined, value adder per worker in rural areas is 45% of the same in the urban areas

Statement 1: Distribution of enterprises by type of ownershi (combined for all activities)

(COMBINE	eu ioi aii ac	tivities)							
Type of		pei	centage	of enter	prises by	type of ow	nership
